

Actuators :-

How many beans have been loaded
Health of app
About env
Threads
Heap
Config props loaded

--> Actuators are used to provide production ready features for our application (Monitor and Manage our application)
--> To work/add actuator in our project we need to add following dependency

```
<dependency>
  <groupId>org.springframework.boot</groupId>
  <artifactId>spring-boot-starter-actuator</artifactId>
</dependency>
```

==>

We must add below configuration props in application.properties/yml file to expose all predefined actuators endpoints

management.endpoints.web.exposure.include=*

Out of all if we want to exclude some of the endpoints then we can add

management.endpoints.web.exposure.exclude=env,beans

Note: Shutdown is a special endpoint used to stop our application and it is mapped to POST method

(All other predefined endpoints are mapped to GET Request)
