=> JDBC :-

Servlet :- Fundamental ↓

{ Tomcat server | Eclipse JEE }

JEE perspective

=>

==> Brower sends the request (Request is for either static or dynamic response)
==> Server accepts request and identify whether the req is for static res or dynamic response
==> If the request is for static res then server will response back with static page or resource (html)
==> If the request if for static and if server couldn't identify the static resource then it will generate 404 not found error
==>If the request is for dynamic res, then server will identify which .java file to pass the request from browser.
==> We use annotations/xml file to inform server s/w that which .java file to map with request from browser.
